

Lessons learned from a decade of disposal-induced Oklahoma seismicity for future regional approaches to gigaton-scale carbon storage

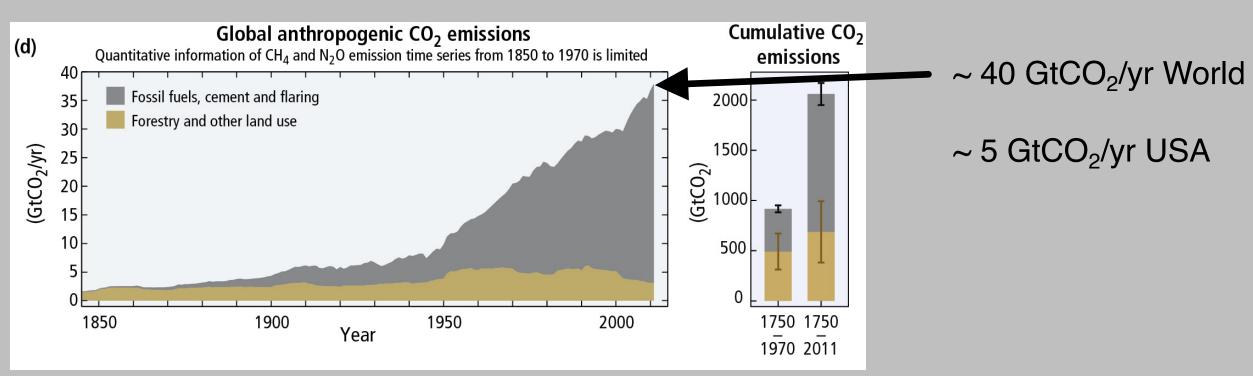

Jake Walter

Oklahoma Geological Survey

jwalter@ou.edu

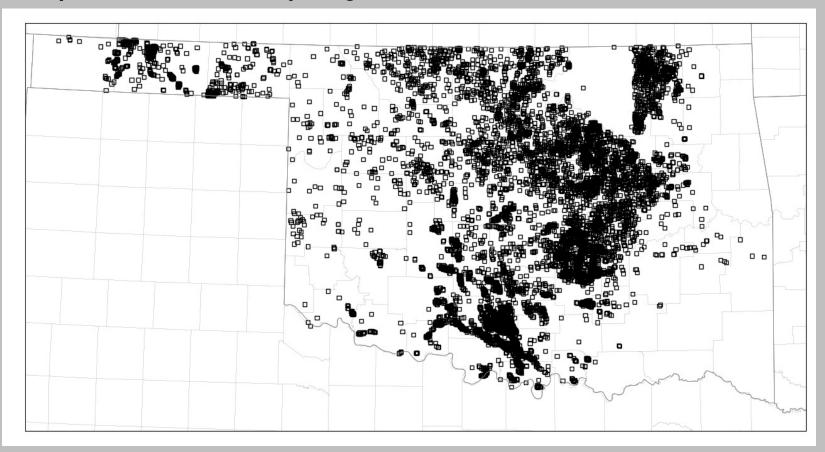

#### **Emissions**

2015 National Academies Climate Intervention report – "Recommendation 2: The committee recommends research and development investment to **improve methods of carbon dioxide removal and disposal at scales that would have a global impact on reducing greenhouse warming**, in particular to minimize energy and materials consumption, identify and quantify risks, lower costs, and develop reliable sequestration and monitoring"

### Decatur, Illinois – 1 Mt over 3 years at a cost of \$200 million

~14,000 Class II wells within the Oklahoma Corporation Commission Underground Injection Control program

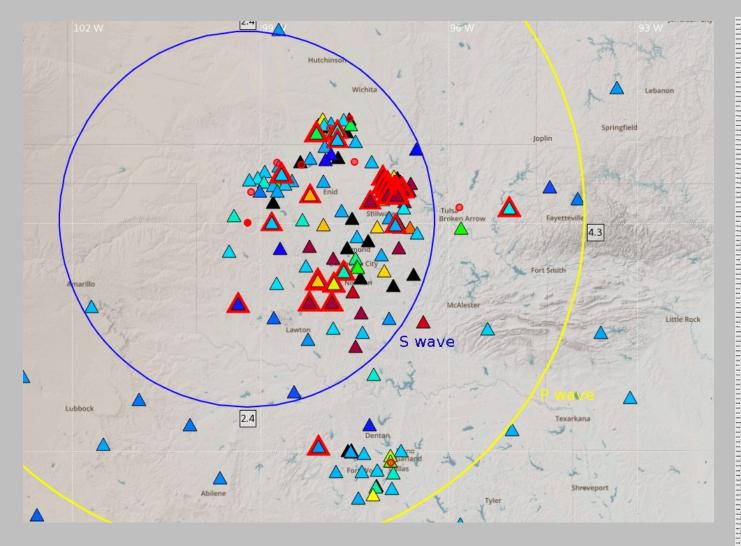

Long-term carbon storage needs to be broadly distributed with a regional approach to risk

Leverage new technologies in hardware and software

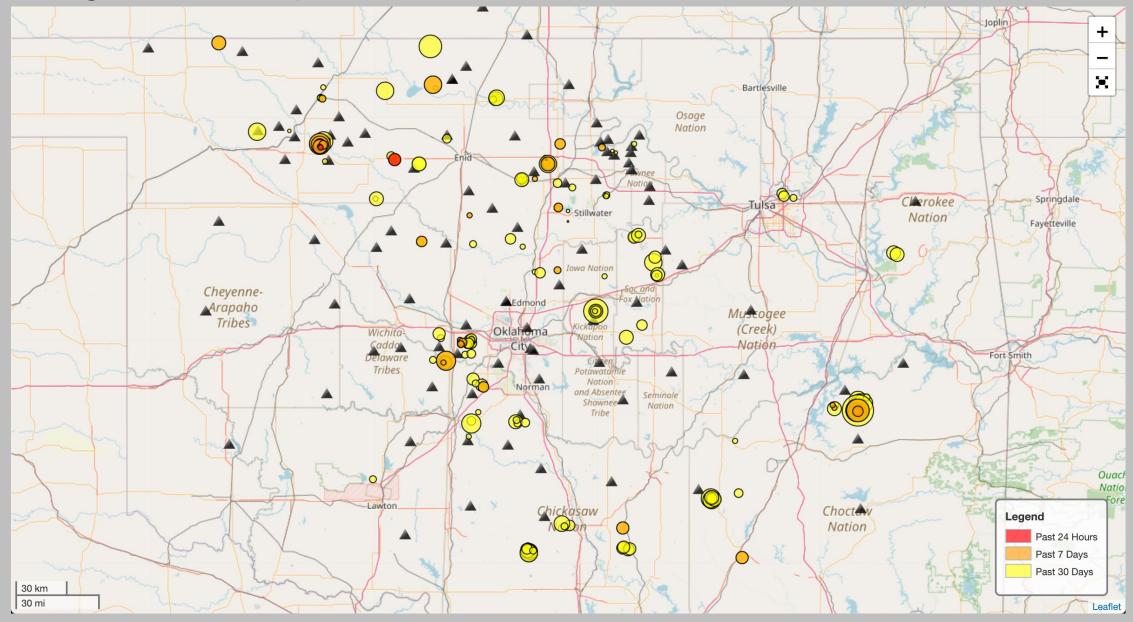

Jake Walter, Ph.D. – State Seismologist Paul Ogwari, Ph.D. – Geophysicist Fernando Ferrer – Lead Analyst/Metadata Andrew Thiel – Analyst/Outreach/Field Isaac Woelfel – Field Technician

#### ogs.ou.edu for products, rtserve.ou.edu for real-time seedlink buffer

~15-20 earthquakes/day

#### As of May 29, 2019 - OGS is the authoritative regional network in the state, so USGS published are reported by OGS

Summary – full turnkey earthquake catalog tool, including FDSN waveform download and QuakeML event file creation

1. Detect – Choose machine-learning picker, either the generalized phase detector (Ross et al., 2018) or EQTransformer (Mousavi et al., 2020)

2. Associate and locate - Modified PhasePApy 1D associator (Chen and Holland, 2016)

- 3. Magnitude Compute preliminary magnitude
- 4. Full QuakeML file event files

5. Input it into SeiscomP system for analyst review or output various file formats for relocation or focal mechanism determination

#### easyQuake python package

WORK FLOW	<u>Continuous mode</u>	Event mode
1. Download data	download_mseed	download_mseed_event
2. Run machine-learning phase detection	detection_continuous	
3. Associate phase picks for event detection	association_continuous	/
4. Combine all associated events in project folder and locate with hypoinverse	combine_associated	
5. Compute local magnitudes and form a fully-populated QuakeML file, with P-wave first motion polarity	magnitude_quakeml	magnitude_quakeml
(Optional) Output hypoDD file	quakeml_to_hypodd	quakeml_to_hypodd
(Optional) Output hash input files for focal mechanism	quakeml_hashpy	quakeml_hashpy

Can be run on data collected already or direct it to download data from FDSN servers

			easyQuake			
			Simplified machine-learning python package.	driven earthquake detection, location,	and analysis in one easy-to-in	plement
			On most systems you should	d be able to simply:		
			pip install easyQuake			
			To stay on the bleeding edge	e of updates:		
			pip install easyQuake	upgrade		
			Or if you need to tweak som	ething, like the number of GPUs in gpd_	predict, you could:	

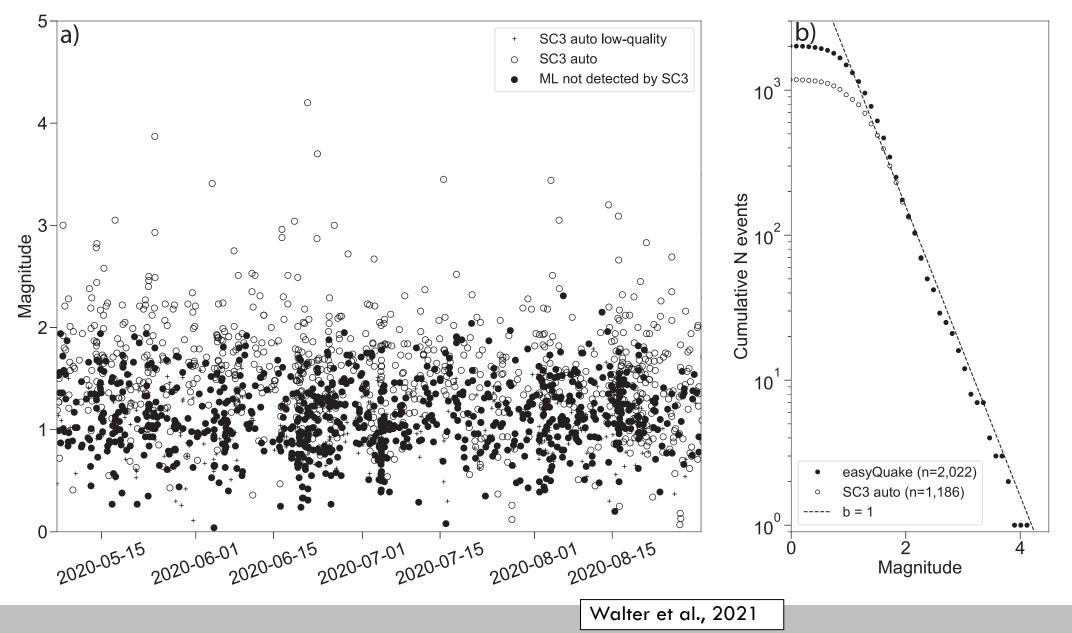

conda create -n easyquake python=3.7 anaconda conda activate easyquake conda install tensorflow-gpu==2.1 conda install keras conda install obspy -c conda-forge pip install easyQuake

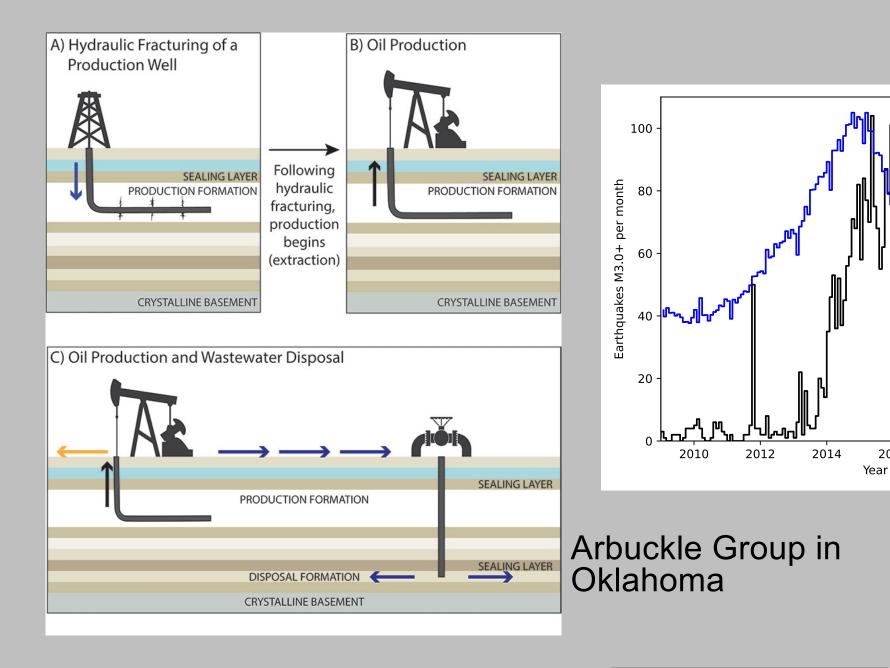

#### Email me: jwalter@ou.edu

Walter, J. I., P. Ogwari, A. Thiel, F. Ferrer, and I. Woelfel (2021), easyQuake: Putting machine learning to work for your regional seismic network or local earthquake study, *Seismological Research Letters*, https://doi.org/10.1785/022020226.

Future: near real-time and expanding modularity (new pickers, direct hypoDD or HASH functionality rather than just producing outputs, plotting, statistics)

#### Machine-learning/AI to find smaller earthquakes

2020

2016

2018

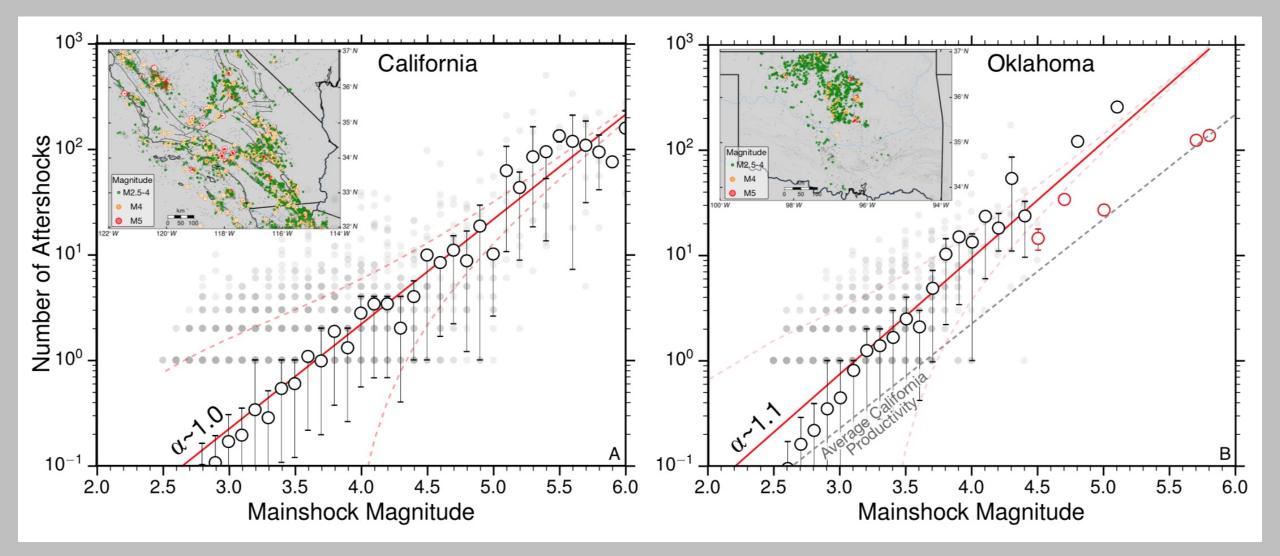

Walter et al., 2020

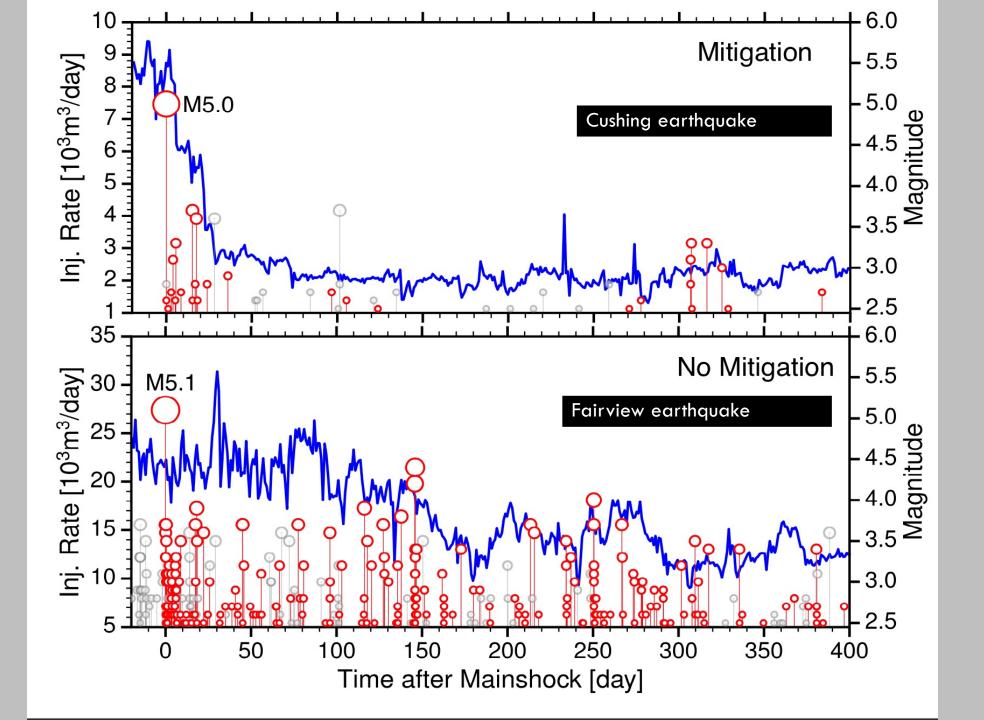

- November 2011 Magnitude 5.7 near Prague, OK September 2016 Magnitude 5.8 near Pawnee, OK November 2016 Magnitude 5.0 near Cushing, OK

Goebel et al., 2019

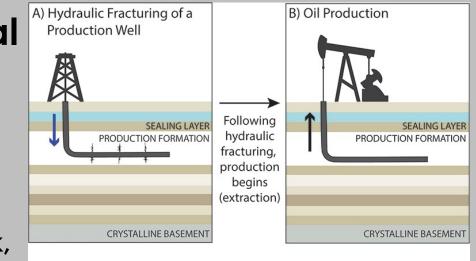

# Lessons from mitigating wastewater disposal seismicity

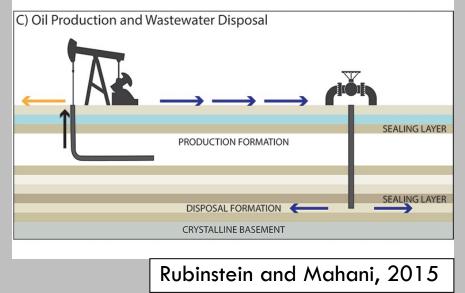

High volume disposal more likely seismicity (Weingarten et al., 2015; Walsh and Zoback, 2016)

Proximity to faults (Darold and Holland, 2015; Alt and Zoback, 2017) and basement (Hincks et al., 2018)

Rapid shut-in reduces aftershock activity by plausibly reducing poroelastic stress (Goebel et al., 2019)

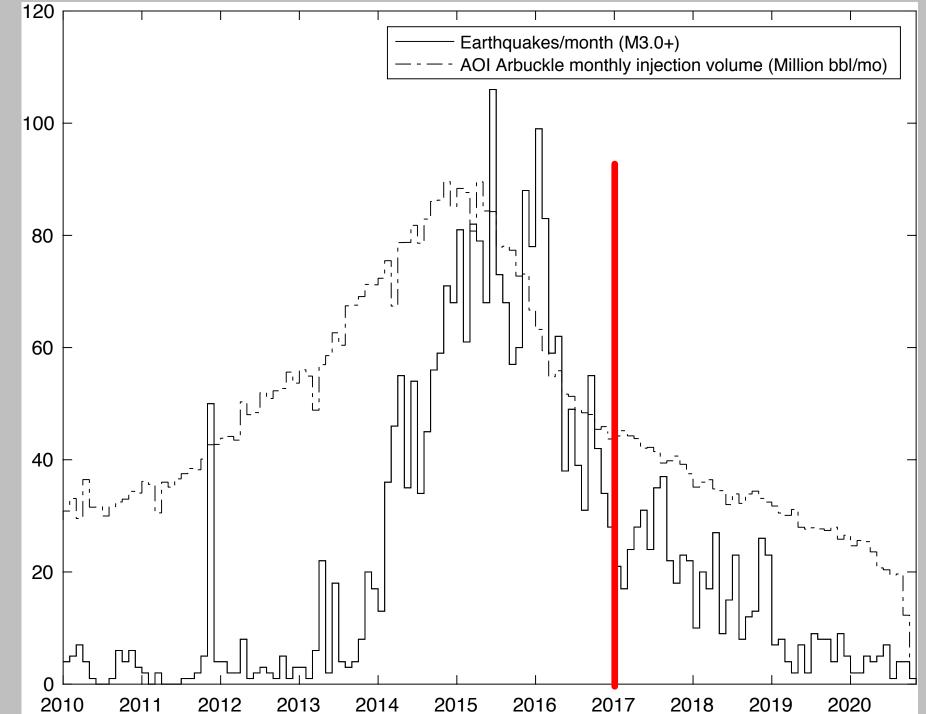

Long-term regional reduction in wastewater disposal in Arbuckle driven by market and regulatory factors

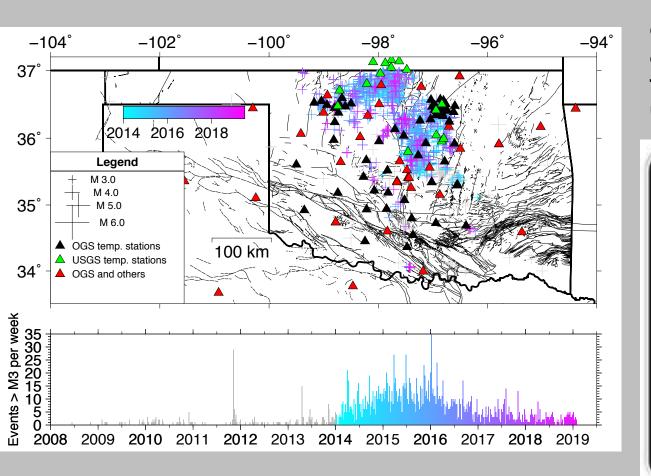

Holland, 2013 – HF triggered seismicity in S Oklahoma

Skoumal et al., 2018 – results from this paper were available in 2016 suggesting HF triggered seismicity common across wide swath of SCOOP/STACK

#### **Oklahoma Geological Survey**

#### **Oklahoma Corporation Commission**

Oklahoma Corporation Commission Protocol for earthquakes associated with well completions, as tracked by their FracNotice (issued Dec 20, 2016, since updated)

#### SUMMARY OF WELL COMPLETION SEISMICITY GUIDANCE

Terms: Oil and Gas Conservation Division (OGCD) Oklahoma Geological Survey (OGS)

### M2.0

Action following anomalous seismic activity within 1.25 miles of hydraulic fracturing operations:

- If magnitude, as determined by the OGS, is greater than or equal to 2.5M:
  - OGCD contacts designated representative for the operator with active completion operations within a 2 km radius of located seismic events.
  - o Implementation of the operator's internal mitigation practices commences.
  - o Operation continues.
- If magnitude is greater than or equal to 3.0M:

M2.5

M3.0

- Operator initiates a pause of operations for no less than 6 hours.
  Technical conference/call held between the OGCD staff and operator about
  - operator mitigation practices.
- Upon agreement between operator and OGCD regarding mitigation practices and reduced seismic activity, operator permitted to resume with revised completion procedure.
- If magnitude is greater than or equal to 3.5M:

• In-person technical conference held with OGCD staff and operator to examine whether operation can resume with changes.

# Data caveats for OGS analysis for HF association

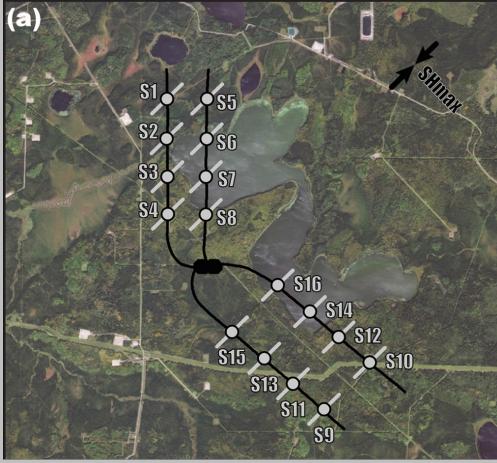

OCC FracNotice (since Dec 2016) began requiring operators to provide at least 48 hours notice of HF completion and <u>intended</u> duration, # of stages, volumes

OCC uses OGS real-time catalog to determine their own spatial/temporal association according to the directive

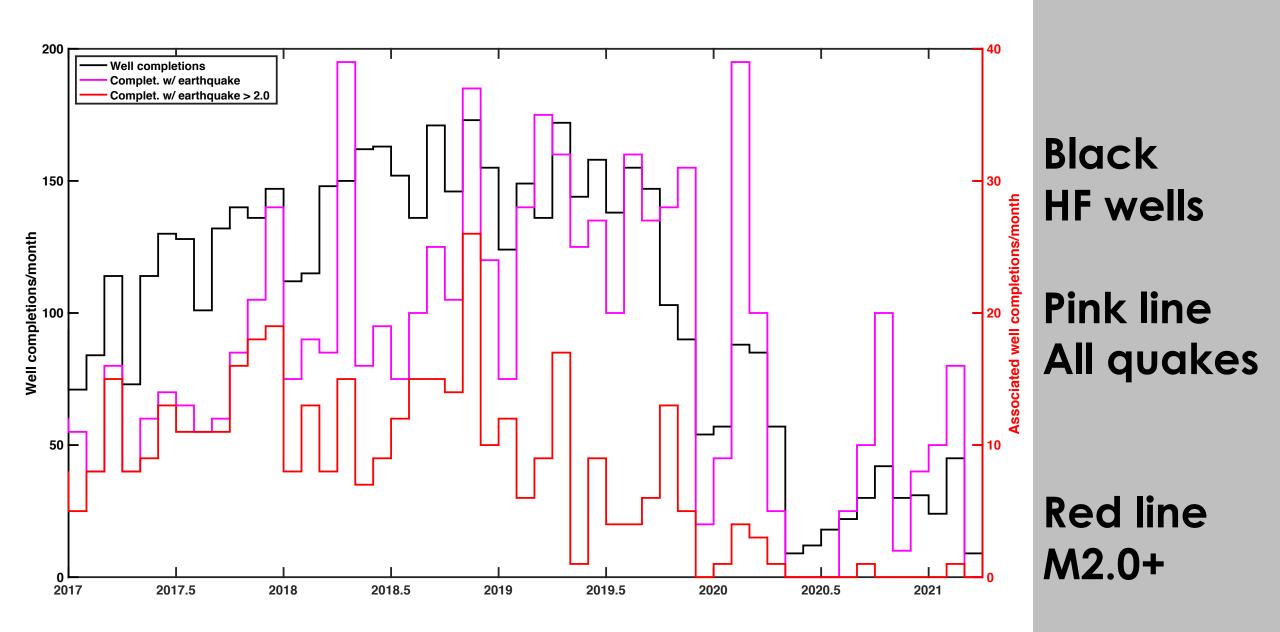

OGS expanded the network into western and southwestern Oklahoma in late 2016/early 2017

OGS participates in technical conferences with OCC on occasion or investigates specific case studies

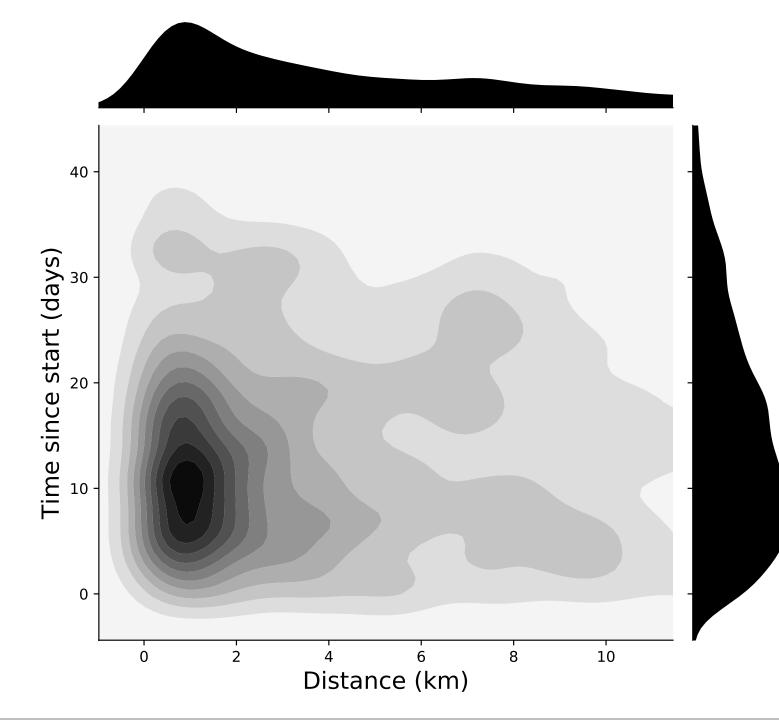

OGS does not have access to real-time denser private networks in the area

Schultz et al., 2020

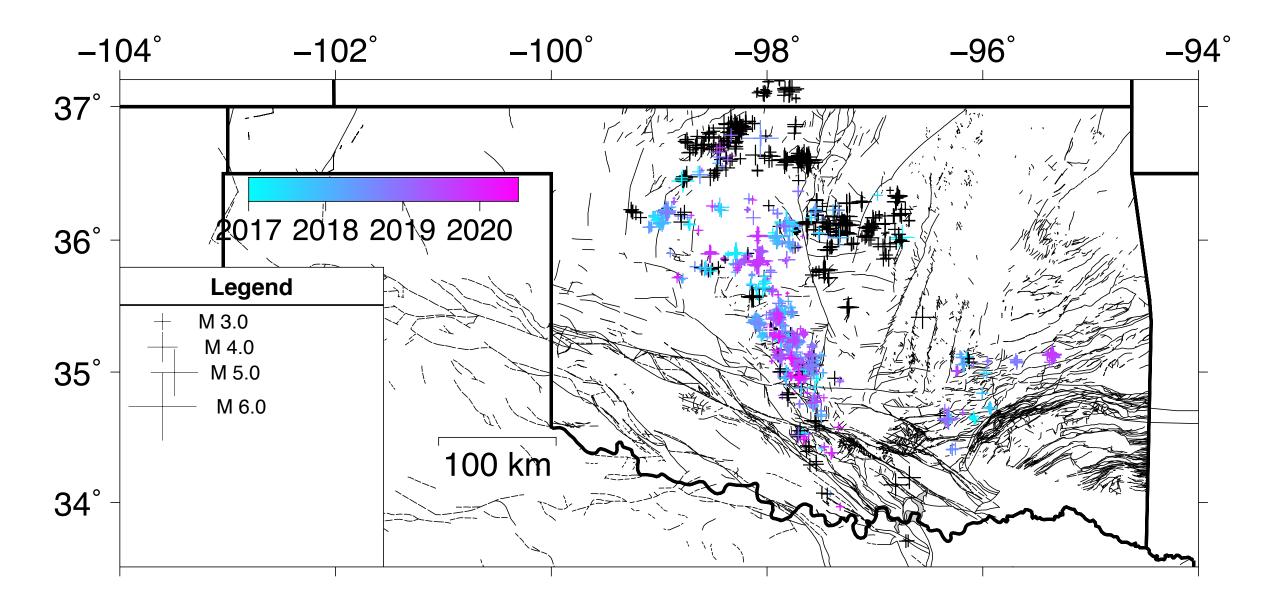

Monthly HF and HF-associated activity

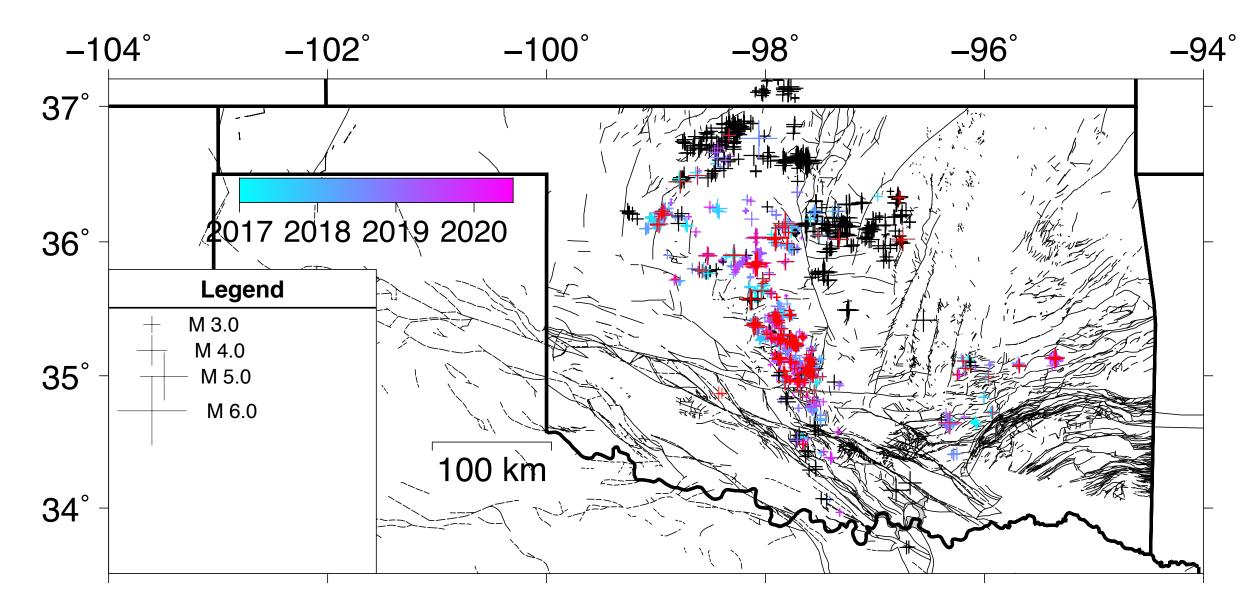

Time and radial distance of seismicity during HF with 20 day buffer afterwards

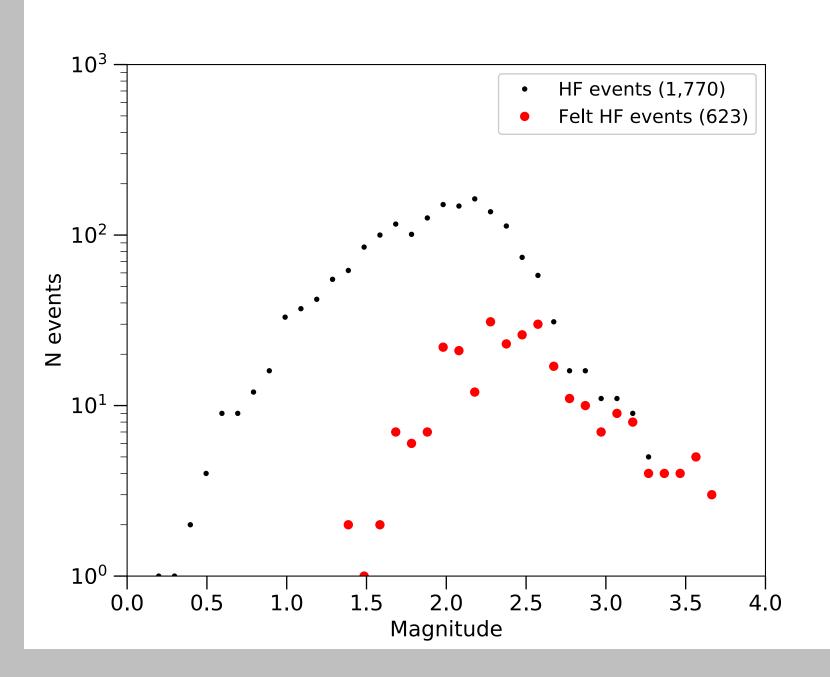

4 km and 20 days is a conservative estimate

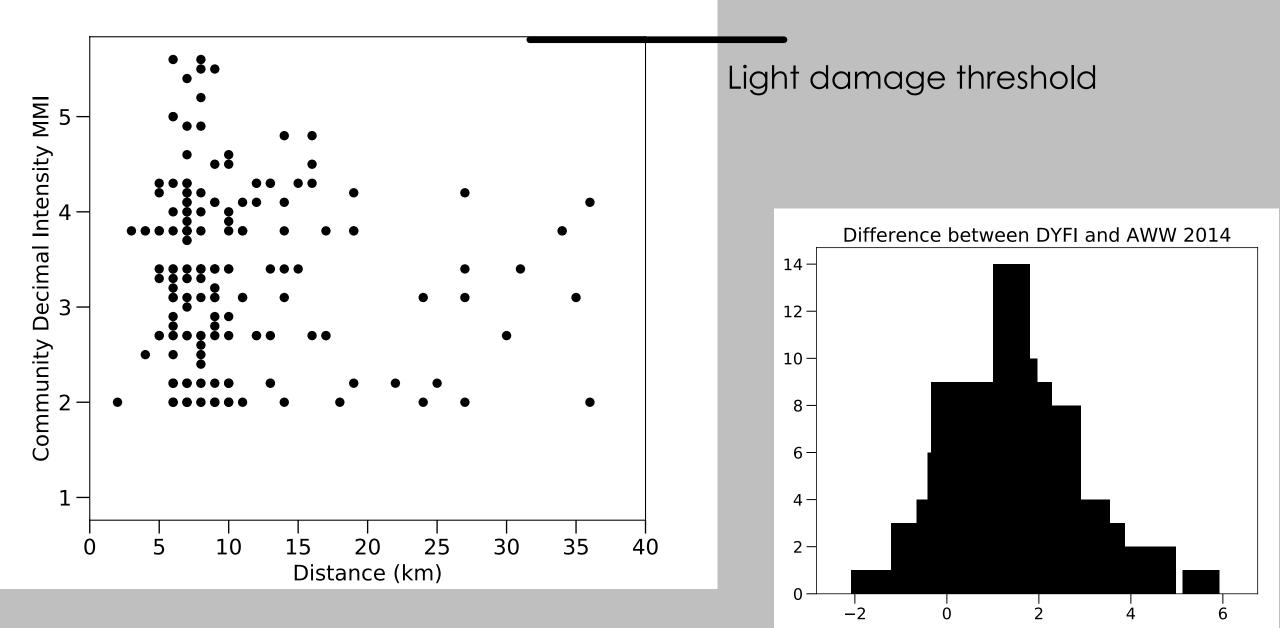

## **HF-associated activity**

HF-associated activity (red DYFI or "felt" events)

Simple spatio-temporal association at 4 km and 20 days in time

Out of 5,404 completions since Oct 2016:

515 fracs or about 9% associated with earthquake of any size

194 fracs were associated with a felt event (from DYFI) or about 4%

Largest earthquake(s) M3.6

Interesting anecdotes: Potential damage from a M3.2 HF-triggered earthquake and felt reports from M1.8 earthquakes

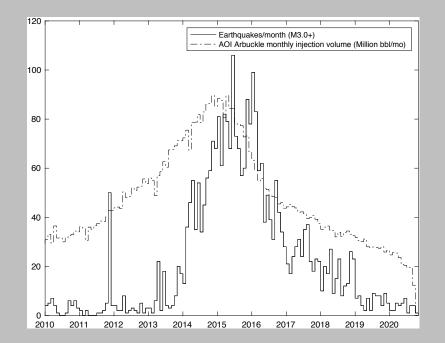

#### SUMMARY OF WELL COMPLETION SEISMICITY GUIDANCE

Terms: Oil and Gas Conservation Division (OGCD) Oklahoma Geological Survey (OGS)

Action following anomalous seismic activity within 1.25 miles of hydraulic fracturing operations:

- If magnitude, as determined by the OGS, is greater than or equal to 2.5M:
  - OGCD contacts designated representative for the operator with active completion operations within a 2 km radius of located seismic events.
  - Implementation of the operator's internal mitigation practices commences.
    Operation continues.
- If magnitude is greater than or equal to 3.0M:
  - o Operator initiates a pause of operations for no less than 6 hours.
  - Technical conference/call held between the OGCD staff and operator about operator mitigation practices.
  - Upon agreement between operator and OGCD regarding mitigation practices and reduced seismic activity, operator permitted to resume with revised completion procedure.
- If magnitude is greater than or equal to 3.5M:
  - Operator suspends operations
  - In-person technical conference held with OGCD staff and operator to examine whether operation can resume with changes.

Hydraulic fracturing – injection occurs over days, mitigation on hours

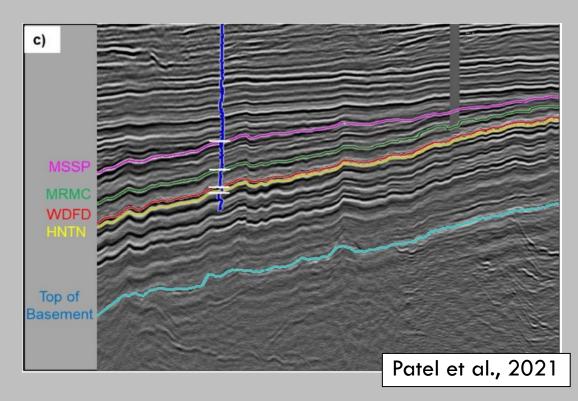

Wastewater injection - injection for several years, mitigation for several years?

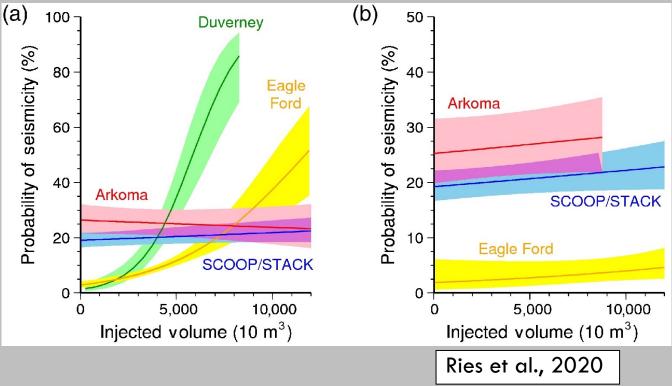

Rapid mitigation appears to successfully reduce aftershock productivity

# **Causal factors?**

No strong dependence upon volume

Geology?

Swetal Patel's recently published work from 3D seismic attributes suggests basement structures extend into the sedimentary column

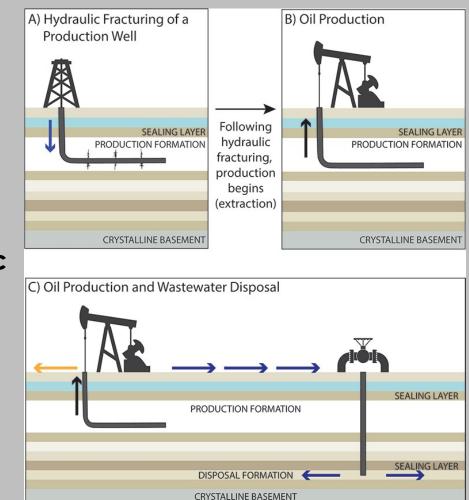

Lessons from for mitigating <del>wastewater</del> disposal seismicity hydraulic-fracture triggered seismicity

Volume - No clear dependence on volume (Ries et al., 2020)

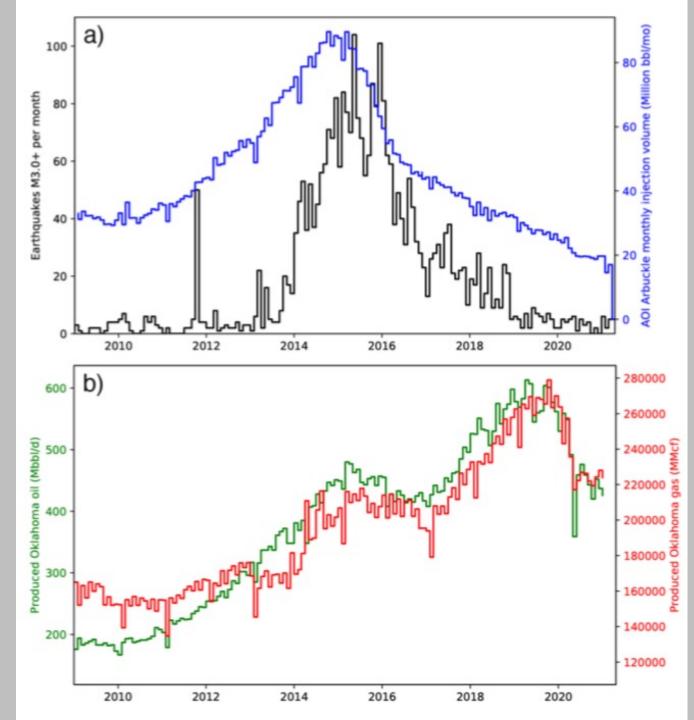

Geology and faults – Seismogenic structures visible in seismic attributes, though subtle (Patel et al., 2021)

Rapid mitigation – traffic light pauses seem effective in reducing damaging events, operators report anecdotal success at implementing traffic light approaches set at 1 magnitude unit below the regulatory one

Safety conscious proactive approach seems to have led to Oklahoma increasing production of both oil and gas relative to 2014/2015 production levels, without the accompanying damaging earthquakes during that past time period

Rubinstein and Mahani, 2015

Large earthquakes are rare, but have incurred ~\$10 million damage total (claims paid in Oklahoma), likely an underestimate of actual damage

(\$74 million in gross production taxes collected in September 2019)

OGS Fact Sheet No. 1 Geological Carbon Management in Oklahoma

The Oklahoma Geological Survey November, 2021

- Requests for more insight into Carbon Capture in Oklahoma. OGS produced this fact sheet starting a new series (though there have been previous OGS fact sheets);
- Envisaged CO<sub>2</sub> trapping in regard to the storage estimates for OK geology;
- Primer on some of the jargon
- Available for download now: ogs.ou.edu

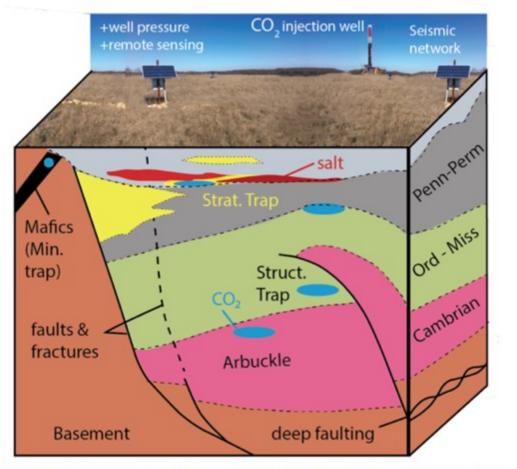

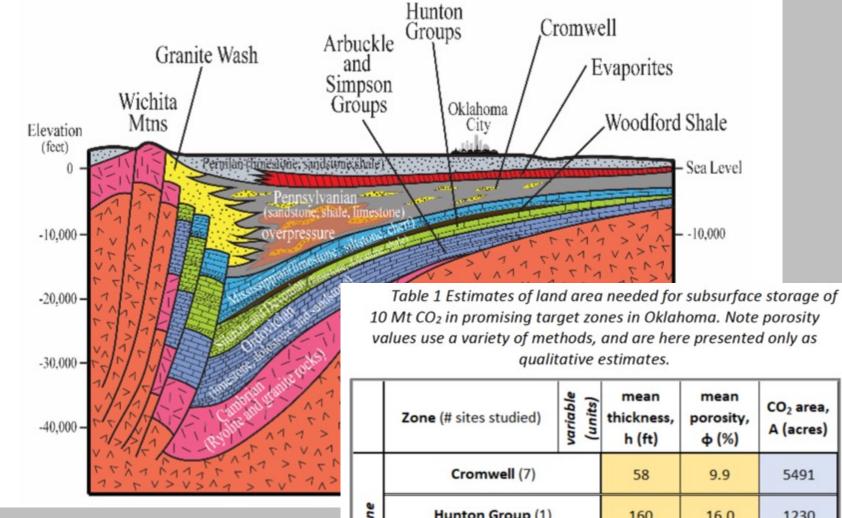

Figure 1. Schematic of carbon management targets in Oklahoma.

Fact sheet quick estimate for 10 Mt storage areas for a few targets: Arbuckle continues to offer high storativity

	Zone (# sites studied)	variable (units)	mean thickness, h (ft)	mean porosity, φ (%)	CO <sub>2</sub> area, A (acres)	
Geological Zone	Cromwell (7)	58	9.9	5491		
	Hunton Group (1)	160	16.0	1230		
	Simpson Group (7)		147	10.7	2002	
	Arbuckle (2)	432	7.1	1026		
	Mafic or Precambrian	1080	3.0	972		
	mean value from OGS geological studies calculated footprint required for storage of 10 Mt CO <sub>2</sub>					

# Heterogeneous state geology with numerous EOR-CCUS opportunities, as well as large CCS opportunities

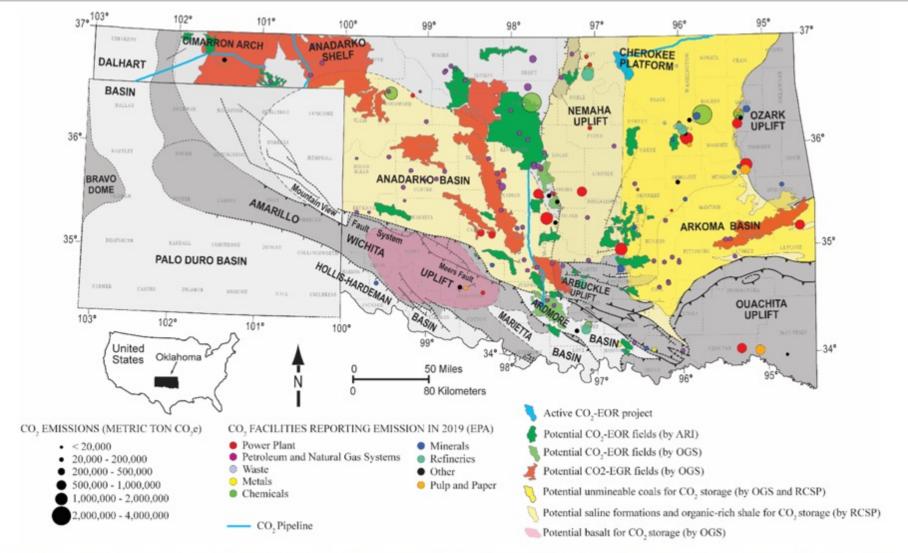

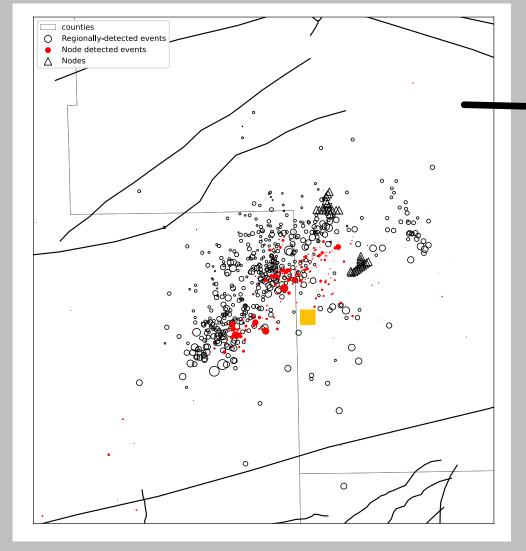

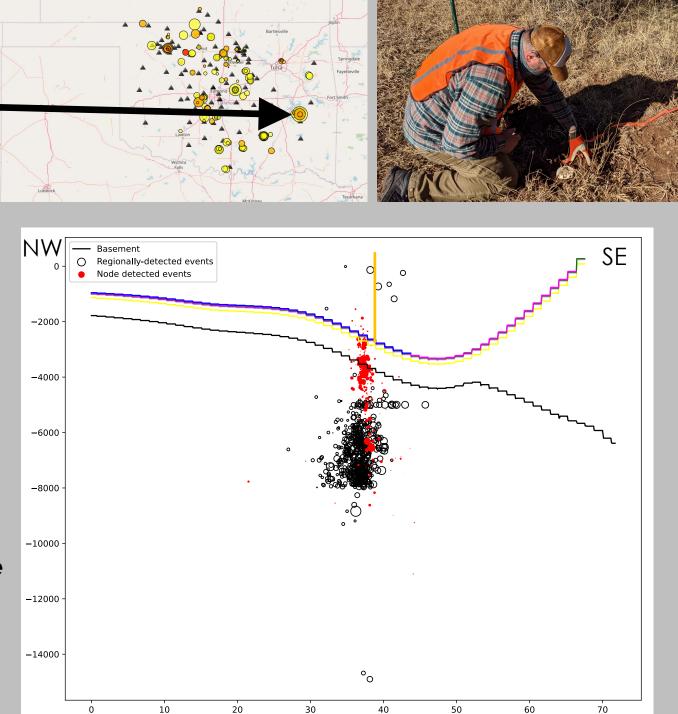

Figure 2. Geological provinces and prominent carbon emissions and facilities <sup>12,22-27</sup>. Major CO<sub>2</sub> emissions are illustrated for the year 2019 along with known CO<sub>2</sub> pipelines, geological provinces, and some major oil and gas fields.

Combining ML-assisted event detection and node deployment for close-up view

- M3.7 in 2019 led to brief shut-in of disposal well and ~1,000 OGS-detected earthquakes since then
- During node deployment we detected 500+ earthquakes, while real-time network detected 89

## Lessons from for mitigating <del>wastewater</del> disposal seismicity hydraulic-fracture triggered seismicity seismicity from longterm carbon storage/EOR

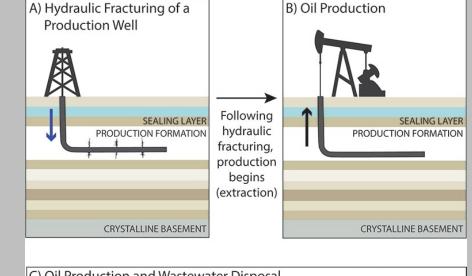

Volume – Probably dependent upon over long-term operation and large volumes

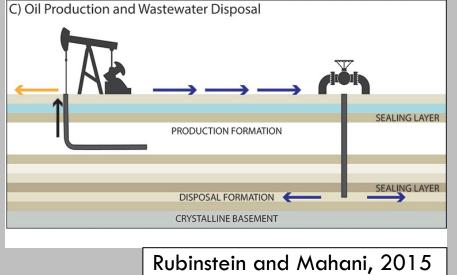

Geology and faults – planning operations to avoid large faults that are oriented for slip; FSP is not effective for planning purposes during permitting

Rapid mitigation – traffic light pauses or disposal shut-in may be effective on hours to days timescales

Clear industry/public agency communication channels and proactive planning can keep the social license to operate intact. When events happen, a clear understanding of the "reaction" (mitigation)

Clear need for comprehensive borehole and surface monitoring by trusted (public) agencies

Additional thoughts? - jwalter@ou.edu
